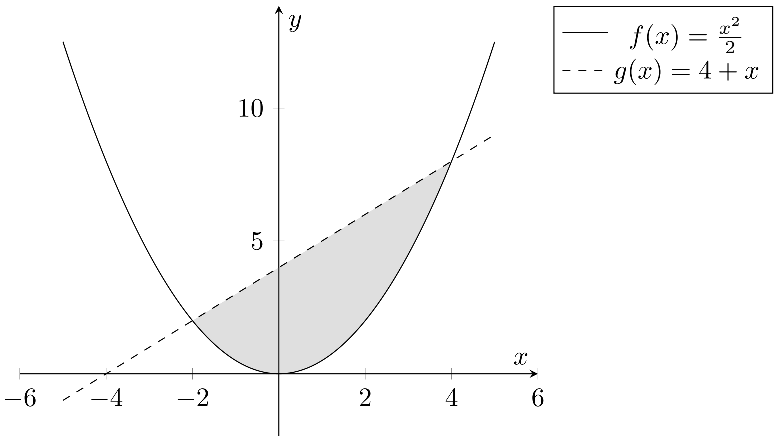
1. How big is the parabolic segment between the parabola $f(x) = \frac{x^2}{2}$ and the line $g(x) = 4 + x$? Sketch a graph to visualize the desired area.

Solution: The functions intersect at $P_1(-2, 2)^T$ and at $P_2(4, 8)^T$. Thus, the area is

$$A = \int_{-2}^{4} g(x) - f(x)\,\mathrm{d}x = \int_{-2}^{4} 4 + x + \left(\frac{-1}{2}\right) x^2\,\mathrm{d}x = \left[\frac{1}{6}x\left(24 + 3x - x^2\right)\right]_{-2}^{4} = -16{+}3x^2 - 0.5x^3$$



2. Given the function

$$f(x) = -2x^2 - 6x^3$$

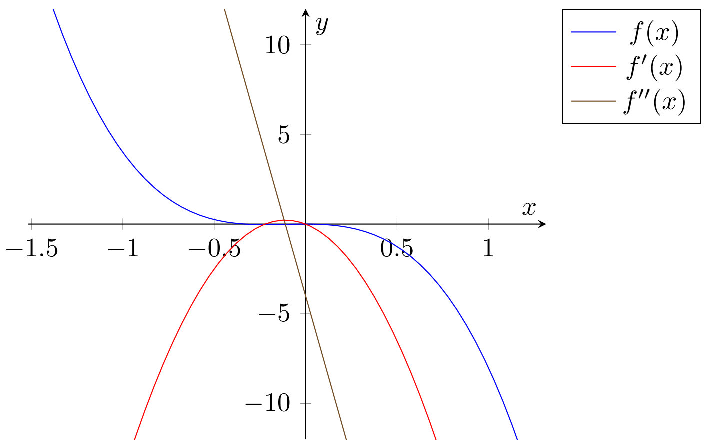
(a) Sketch f, f' and f'' in one coordinate system.

(b) Identify all of the minimum and maximum points and find its inflection points.

Solution:

(a) First, calculate the derivatives

$$\begin{aligned} f(x) &= -2x^2 - 6x^3 \\ f'(x) &= -4x - 18x^2 \\ f''(x) &= -4 - 36x \\ f'''(x) &= -36 \end{aligned}$$



(b) The function f has zeros at $x_1 = \frac{-1}{3}$ and at $x_2 = 0$. The function f' has zeros at $x_3 = \frac{-2}{9}$ and at $x_4 = 0$. The function f has a minimum at $(\frac{-2}{9}, -0.0329218106995885)$ because $f''(x_3) > 0$ and a maximum at $(0, 0)$ because $f''(x_4) < 0$.

3. Find all eigenvalues and eigenvectors of the matrix

$$A = \begin{bmatrix} 4 & -2 \\ -24 & 6 \end{bmatrix}.$$

Solution:

Calculate $A - \lambda I_2$:

$$A - \lambda I_2 = \begin{bmatrix} 4 & -2 \\ -24 & 6 \end{bmatrix} - \lambda \begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix} = \begin{bmatrix} 4 - 1.0\lambda & -2.0 \\ -24.0 & 6 - 1.0\lambda \end{bmatrix}.$$

Then, calculate $\det(A - \lambda I_2)$.

$$\det(A - \lambda I_2) = -48.0 + (4 - 1.0\lambda)(6 - 1.0\lambda)$$

Now, we solve $\det(A - \lambda I_2) = 0$.

The matrix A has the eigenvalues $\lambda_1 = -2$ and $\lambda_2 = 12$.
