1. How big is the parabolic segment between the parabola  $f(x) = 2x^2$  and the line g(x) = 4 + 2x? Sketch a graph to visualize the desired area.

**Solution:** The functions intersect at  $P_1(-1,2)^T$  and at  $P_2(2,8)^T$ . Thus, the area is

$$A = \int_{-1}^{2} g(x) - f(x) dx = \int_{-1}^{2} 4 + 2x - 2x^{2} dx = \left[ \frac{1}{3} x (12 + 3x - 2x^{2}) \right]_{-1}^{2} = 9$$

$$f(x) = 2x^2$$

$$g(x) = 4 + 2x$$

f(x)

f'(x)

## 2. Given the function

Solution:

$$f(x) = 5x^2 - 6x^3$$

- (a) Sketch f, f' and f'' in one coordinate system.
- (b) Identify all of the minimum and maximum points and find its inflection points.

## (a) First, calculate the derivatives

$$f(x) = 5x^{2} - 6x^{3}$$

$$f'(x) = 10x - 18x^{2}$$

$$f''(x) = 10 - 36x$$

$$f'''(x) = -36$$

- (b) The function f has zeros at  $x_1 = \frac{5}{6}$  and at  $x_2 = 0$ . The function f' has zeros at  $x_3 = \frac{5}{9}$  and at  $x_4 = 0$ . The function f has a maximum at  $(\frac{5}{9}, 0.51440329218107)$  because  $f''(x_3) < 0$  and a minimum at (0,0) because  $f''(x_4) > 0$ .
- 3. Find all eigenvalues and eigenvectors of the matrix

$$A = \begin{bmatrix} 6 & -3 \\ -36 & 9 \end{bmatrix}.$$

## Solution:

Calculate  $A - \lambda I_2$ :

$$A - \lambda I_2 = \begin{bmatrix} 6 & -3 \\ -36 & 9 \end{bmatrix} - \lambda \begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix} = \begin{bmatrix} 6 - 1.0\lambda & -3.0 \\ -36.0 & 9 - 1.0\lambda \end{bmatrix}.$$

Then, calculate  $\det(A - \lambda I_2)$ .

$$\det(A - \lambda I_2) = -108.0 + (6 - 1.0\lambda)(9 - 1.0\lambda)$$

Now, we solve  $\det(A - \lambda I_2) = 0$ .

The matrix A has the eigenvalues  $\lambda_1 = -3$  and  $\lambda_2 = 18$ .
